

Graphs for Genealogists
David A Stumpf, MD, PhD
dave@wai.md

Graphs for Genealogists
The future is faster than you think!

An invitation ...

How to Get Involved

An invitation to help build the future of genealogy graph analytics.

Testers

GFG needs testers to shake down new features and provide feedback. You'll get an inside track to the latest features and help influence improvements and new features. To volunteer send us an email.
info@wai.md

Advocates

GFG encourages thought leaders to learn about its capabilities and write reviews for their constituency. To request a demonstration or interview send us an email.
info@wai.md

Developers

GFG is an open source project with modular components. Plug-Ins are coded in Java. If you'd like help design, build or manage new capabilities send us an email.
info@wai.md

Innovators

Have an idea? GFG can help you explore its feasibility and develop a plan. There are many opportunities for entrepreneurs using graphs in genealogy. We'd like to help expand the innovation community.
info@wai.md

Collaborators

Would you like to incorporate graph capabilities into your products? GFG can help. DNA analytics, forensic genealogy, document and image management have significant opportunities.
info@wai.md

Meeting Planners

GFG can provide speakers or workshop leaders who bring graph thinking and methods to your meeting.
info@wai.md

Volunteer: <https://wai.md/gfg>

Collaborators

- **Wesley Johnston**
 - DNA Coverage
 - User's Guide
- **Weidong Yang**
 - GraphXR: 3D visualizations
- **Peter Cunningham**
 - In common with report
 - GDS Bug - Change in neo4j.conf files
- **Michelle Wilson**
 - Endogamy analytics and reporting
- **Ian Logan**
 - mt-haplotree
- **Tim Janzen**
 - Mennonite Project endogamy reporting
- **Philip Gasaatura**
 - Rwanda oral history project

Acknowledgements

Open Source means it's readily available.

But copyrights still apply so that appropriate use can be managed.

The work described here involve assets from a number of sources whose prior work is appropriately used with permission. My thanks to them!

Thinking in Graphs

Leonhard Euler (1707-1783)

Euler is the “father of graph theory” who originally found the bridges of Königsberg problem too trivial for his attention.

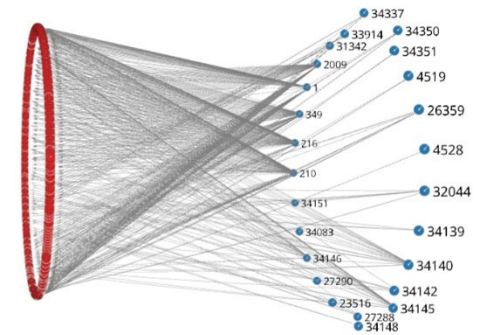

The question was: can you cross each of the seven bridges only once?

Replaced a brute force solution with a graph.

What we'll cover

- The GFG Strategy
- “Thinking in Graphs” Get ready to be amazed
- Why graph methods? Bigger, better, faster
- If graphs, how? The strategy
- Making it feasible
 - Enabling software
 - Professor's Rounds
- What does it do? Seeing is believing.

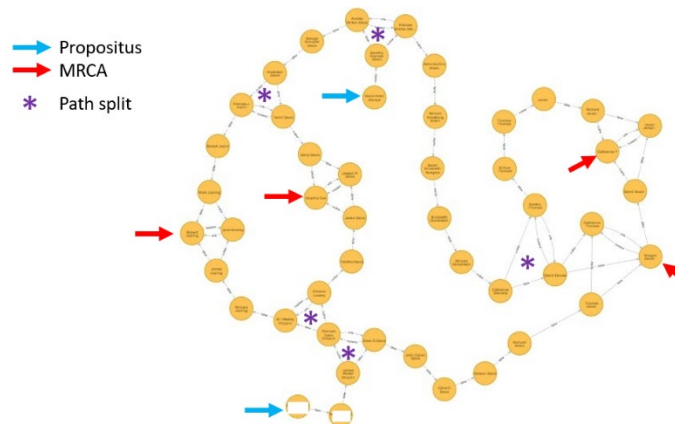

The GFG Strategy

- Align with interests and skills of genealogists
- Use available data
- Tools to do the heavy lifting
- Enhance extant analytic reporting
- Expand the analytic repertoire
- Make it open source; encourage collaboration
- Modular design for numerous graphs
- Support interoperability with 3rd party tools
- Develop standards for genealogy graphs

Feasibility

- Graph database technology is mature
- Genealogy graph resources are available
- Thought leaders are aware
- >100 downloads of GFG software
- First server-based deployments in progress
- Mentoring program in place

GFG: Making the Complex Simple

```
match (s1:Segment)
with s1 order by s1.chr,s1.strt_pos,s1.end_pos
with collect(distinct s1) as segs1
match (m1:DNA_Match)-[r1:match_segment]-(s2:Segment) where s2 in segs1 and r1.cm>=7 and r1.snp_ct>=500 and
r1.p_anc_rn is not null and r1.m_anc_rn is not null
with r1.p_anc_rn as anc_rn,
case when m1.RN>0 then '*' + m1.fullname + ' [' + m1.RN + ']' else m1.fullname end as m2,
case when m1.RN>0 then m1.RN else null end as rns1,
case when r1.m_rn>0 then r1.m_rn else null end as rns2,
case when r1.m_rn>0 then '*' + r1.m + ' [' + r1.m_rn + ']' else r1.m end as m3,
max(r1.cm) as max_cm,min(r1.cm) as min_cm,
s2,count(r1) as edgect,sum(case when r1.p=m1.fullname then 1 else 0 end) as unidir_ct_p,
sum(case when r1.m=m1.fullname then 1 else 0 end) as unidir_ct_m
with anc_rn,s2,min_cm,max_cm,
apoc.coll.union(collect(distinct m2), collect(distinct m3)) as matches,
apoc.coll.union(collect(distinct rns1),collect(distinct(rns2))) as rns,
sum(edgect) as edgect,sum(unidir_ct_m) as unidir_ct_m,sum(unidir_ct_p) as unidir_ct_p order by s2.chr,s2.strt_pos,s2.end_pos
with anc_rn,s2,min_cm,max_cm,
apoc.coll.sort(apoc.coll.flatten(matches)) as matches,
apoc.coll.sort(apoc.coll.flatten(rns)) as rns,
edgect,unidir_ct_m,unidir_ct_p
return s2.chr as chr,s2.strt_pos as start_pos,s2.end_pos as end_pos,apoc.math.round(min_cm,1) as cm,edgect,unidir_ct_p,unidir_ct_m,size(rns) as kits,size(matches) as match_ct,anc_rn,rns,matches
```

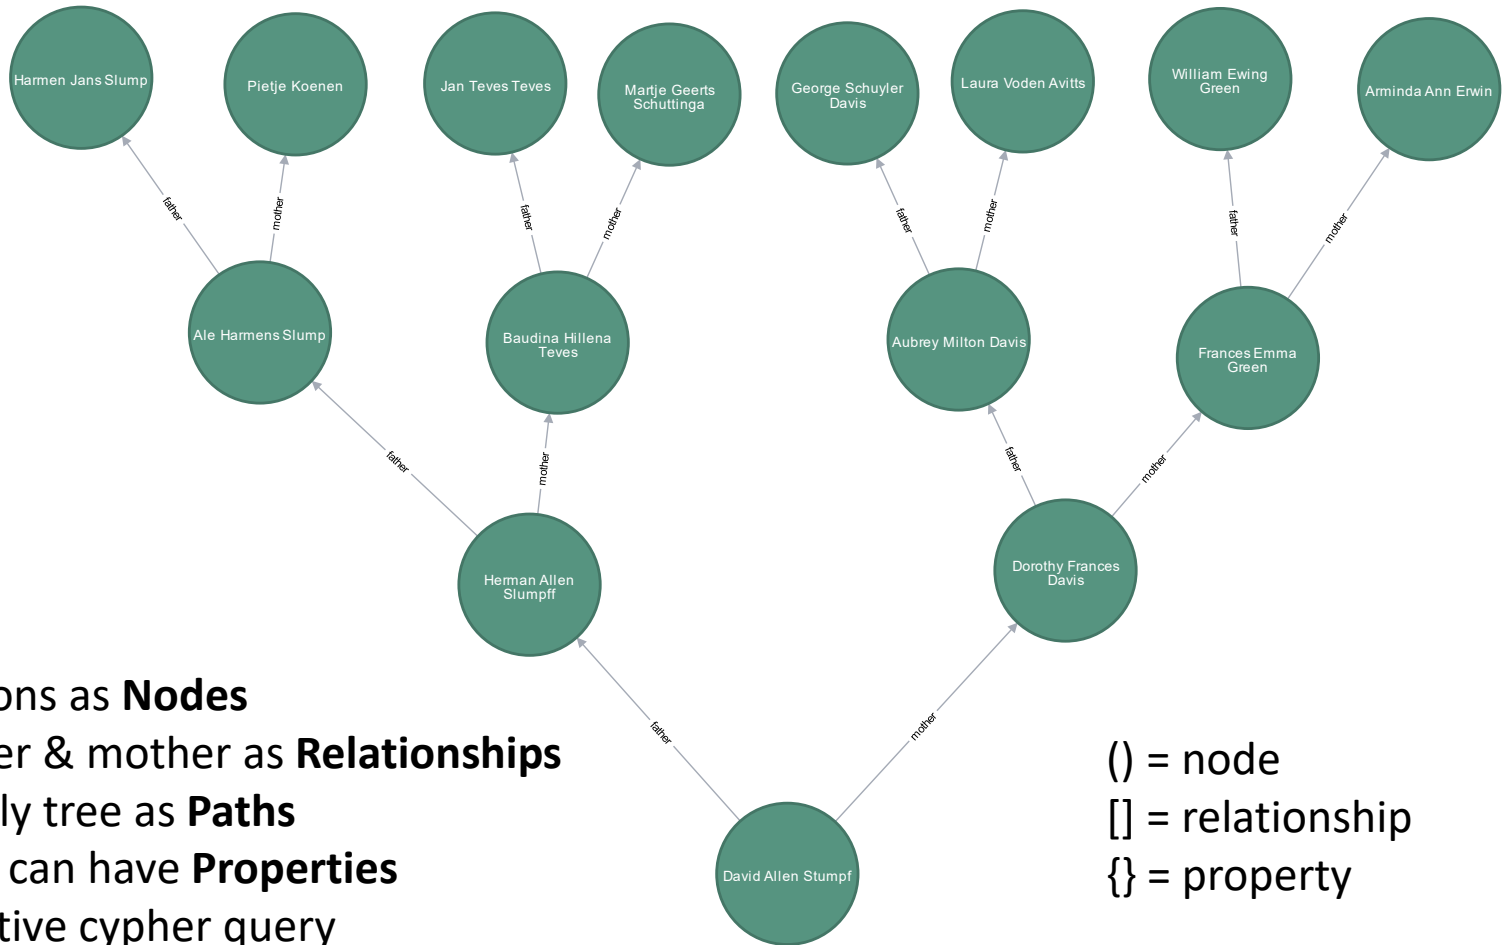

```
matches_by_segments_anc_desc()
```

Why Graph Methods?

- Queries are intuitive
- Big data is manageable
- Little change in performance as data added
- Graph traversals outperform iterations

- Enhancements create knowledge
- Knowledge graphs enable discovery

Thinking in Graphs

Persons as **Nodes**

Father & mother as **Relationships**

Family tree as **Paths**

Each can have **Properties**

Intuitive cypher query

() = node

[] = relationship

{ } = property

```
match path=(p:Person{RN:1})-[r:father|mother*0..3]->(a:Person) return path
```

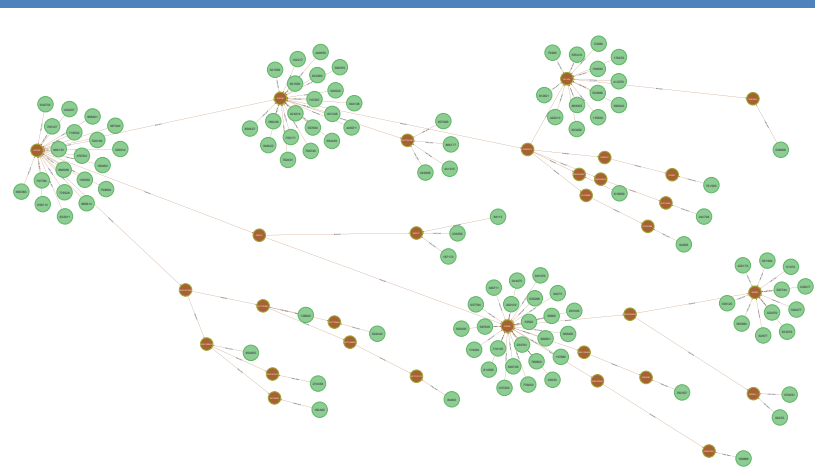

Family Tree Functions

- Patrilineal trees
- Matrilineal trees
- X-inheritance trees
- Double cousins
- Relationships of all in the project
- X-genetic distance for all
- Pedigree completeness
- Correlation of relationship

Haplotrees

- FTDNA
 - Y-haplotree
 - Mt-haplotree
- Analytics
 - Inferred haplogroup => knowledge
 - Clade-mates
 - Dual matches: at- and either Y- or mt-matches
- Display
 - ORDPATH

Graphs as Adjacency Matrices

... when big data is overwhelming

The N^2 problem

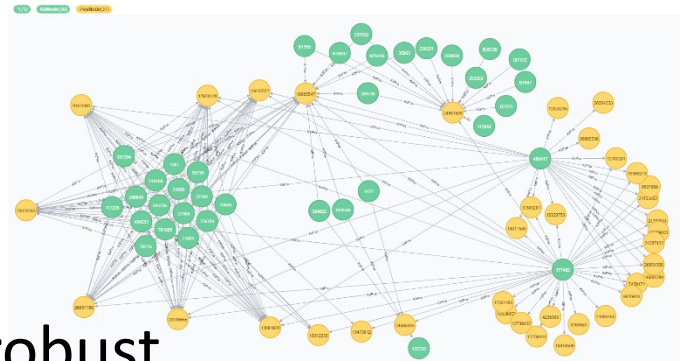

DNA Matches = sparse matrix
Great for limited set of close matches
Quickly become non-computable
Graph methods handle 250,000 matches
Avoids a 62 trillion cell matrix!
Performs well

$$\begin{pmatrix} 0 & 2 & 0 & 1 \\ 2 & 0 & 2 & 1 \\ 0 & 2 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{pmatrix}$$

Thinking in Graphs

Avoid a common trap

- If you've worked with relational databases
 - Nodes \cong tables
 - Relationships \cong joins
 - Properties \cong table fields
- Don't do this!
 - It's a simplification that is not robust
 - It diverts you from thinking differently
- Graphs have new first-class citizens
 - Relationships are more robust than joins
 - Path and List data types are not in relational systems
- Graphs are a unique ecosystem

NoSQL databases are NOT native graph databases

New Ways of Thinking

- Can I relate these two graphs?
- What properties should the relationship have?
- How do I speed up traversal queries?
- Can I create a new perspective? Union tree?
- What can I do with traversal collected data?
- How do I manage provenance of data?
- How do I leverage graph specific capabilities?
- How can I enhance the knowledge graph?

Think in Path Traversals

- Query uses an index to find start node(s)
- Traverses from start through relationships
- Several methods for collecting data as **Lists**

- Graphs have data types
 - Node
 - Relationship
 - Path
 - List

Each can have properties
which can be indexed

Ahnentafel from traversal data

Collecting 1's and 0's

```
match path=(n:Person{RN:27})-[r:father|mother*0..2]->(x)
with x.fullname as Name, '1' + reduce(srt="", q IN nodes(path)|srt + case when
q.sex='M' then '0' else '1' end ) AS Anh
with Name, '1' + right(Anh,size(Anh)-2) as Ahnen
return Name,Ahnen as Ahen_base_2 , gen.rel.ahnentafel(Ahnen) as Ahnentafel
| order by Ahnentafel
```

Name	Ahen_bas	Ahnentafel
Anderson	1	1
William H	10	2
Tabitha Br	11	3
John Dem	100	4
Nancy Mc	101	5
Joshua H.	110	6
Rebecca L	111	7

Triple magic

Adding record numbers and sex

Name	gen	sex_path	Ahnentafel	Dewey	ORDPATH
Martha Elizabeth Stinnett [32] (1843-1928)	0	F	1	[32]	1018
Samuel Lewis Stinnett [63] (1822-1864)	1	FM	2	[32,63]	101810127
Alpha Loggins [64] (1823-1906)	1	FF	3	[32,64]	101810128
Mary Elizabeth Nichols [101] (1785-1855)	2	FMF	5	[32,63,101]	1018101271100d
Samuel Loggins [102] (1776-1826)	2	FFM	6	[32,64,102]	1018101281100e
Martha Scott [103] (1795-1880)	2	FFF	7	[32,64,103]	1018101281100f
William Nichols [130] (1754-1850)	3	FMFM	10	[32,63,101,130]	1018101271100d11002a
Nancy Blankenship [131] (1765-1850)	3	FMFF	11	[32,63,101,131]	1018101271100d11002b

- X-chromosome ancestors of Martha Elizabeth Stinnett
- Sex path excludes male to male inheritance
- Dewey is an aggregation of record numbers of persons in the path
- ORDPATH a hexadecimal number created from the Dewey by a UDF
- Notice that sorting on the Dewey will not order the list properly
- Sorting on ORDPATH provides a proper sort
- SQL Server hierarchyId datatype is an ORDPATH string

O'Neil, P. *et al.* ORDPATHs: insert-friendly XML node labels. in *Proceedings of the 2004 ACM SIGMOD international conference on Management of data* 903–908 (Association for Computing Machinery, 2004).

<https://www.cs.umb.edu/~poneil/ordpath.pdf>

Common ancestors

... bread and butter graph task

```
match (p1:Person{RN:1})-  
[r1:father|mother*0..15]->(mrca:Person)-<-[r2:father|mother*0..15]-  
(p2:Person{RN:600})  
return collect(mrca.fullname) as mrca
```

- Pictured pedigree: Query returns grandparents
- Two paths converge on MRCA(s)
- Three variables define a relationship
 - Path length 1
 - Path length 2
 - MRCA count
- Represent as concatenated string
 - Pictured 2:2:2 = 1C
 - 2:2:1 = H1C
 - 4:5:1 = H3C1R
- fam_rel node set also includes Shared Centimorgan Project data

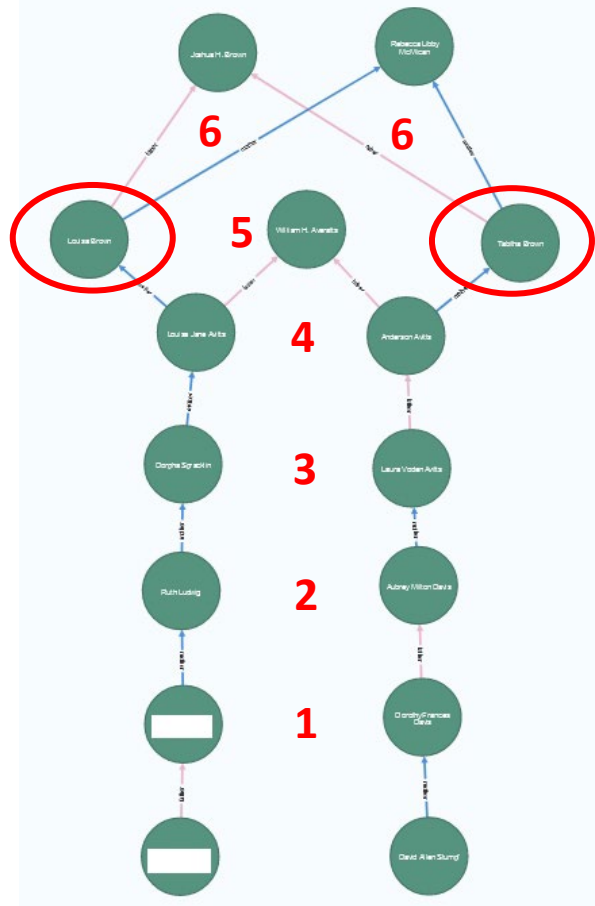

Node Properties

fam_rel

<id>	52093
HighSharedCM	1225
Indx	2:2:2
LowSharedCM	553
MeanSharedCM	874
nmrca	2
path1	2
path2	2
relationship	1C

There are many GFG functions for common ancestors

Easier to see in a graph

My 3G grandfather married sisters

His descendant is both my 5C and H4C, sharing 3 MRCAs in two different generations.

5:5:1 = H4C

6:6:2 = 5C

The sisters' children are $\frac{3}{4}$ siblings

Correlation of Relationship

... a number with added value

- Single value
- Detailed view
 - Count hops on each path and do the math
 - Estimate or look up the expected shared cM

propositi	relationship	ancestors	path1	path2	genetic_distance	COR
David Allen Stumpf 1 (1945-); anonymized 26429 (-)	H5C	Rebecca Libby McMican 4607 (1790-1863)	6	6	12	.0002441
David Allen Stumpf 1 (1945-); anonymized 26429 (-)	H5C	Joshua H. Brown 4441 (1780-1840)	6	6	12	.0002441
David Allen Stumpf 1 (1945-); anonymized 26429 (-)	H4C	William H. Averatts 53 (1813-2022)	5	5	10	.0009766

The total COR is 0.00146484375						
From the shared centimorgan project the expected value and range is unknown cm.						
The observed shared DNA is 82.9.						
The predicted DNA is $0.00146484375 \times 6000 = 8.7890625$ cm						
UDF:						
return gen.rel.shared_DNA(1,26429)						
The coefficient of relationship (COR) is a measure of pedigree collapse resulting from ancstors appearing more that one in the family tree.						
The paths are the generations to the common ancestor for each person in the analysis.

0 - 117

COR, if available, can be a better filter than relationship or centimorgans.

What's going on?

The illusion of linearity is exposed in a log-log plot

Is segregation really random?
Are there outliers?

Sticky segments?
Selection bias?
Something else?

COR Predicts Actual Shared cM?

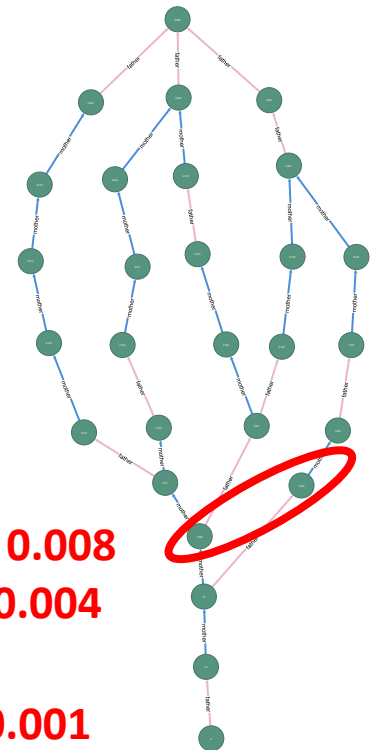

COR Predicts Actual Shared cM?

Mother Nature and “Thinking in Graphs” offer some possible explanations.

Pedigree Collapse

- Duplicate ancestors
- Multiple positions in a standard pedigree chart
- Multiple paths
- Coefficient of inbreeding
 - Most recent endogamous ancestor
 - COR of MREA halved for each descendant generation

Graph Topology

Paths in Endogamy

- Paths are first-class citizens in a graph database
- GFG creates path nodes and relationship to them
- Path have intersections
- GFG creates intersect nodes and path-intersect relationships

Getting Started

- Explore the [GFG Blog](#)
- Join the [FB GFG Forum](#)
- Wes Johnston's [Guide to Getting Started with GFG](#)
- Download [GFG Software](#)
- Install [Neo4j Software](#)
- Mentoring at [Professor's Rounds](#)

Neo4j

- “Native” Graph Database
- Industry leader
- Open Source
- Free versions
- PlugIn functions and procedures
 - From Neo4j:
 - [APOC](#): awesome procedures on cypher
 - [GDS](#): graph and machine learning algorithms
 - GFG capitalizes on these, adding ~200 functions

The GFG Neo4j Plugin

~200 functions

- Loads GEDCOM and FTDNA data files
- Uses curated files to link graphs
- Loads reference data
- Generates reports
- Uses Neo4j Plugins
- Memorializes analytics => knowledge graph
- Optimized schema => perhaps a standard?
- Incremental learning for users

Curation by the Genealogist

PATERNAL

Field of Dreams: Avatars

... *in silico* reconstruction of ancestors

- Your ancestor emerges from the corn field
- DNA available for your research
- Quick and easy in a graph database

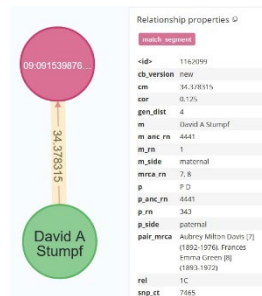

<https://www.wai.md/post/the-field-of-dreams-ancestor-avatars>

Knowledge Graph

... enables amazing advanced analytics

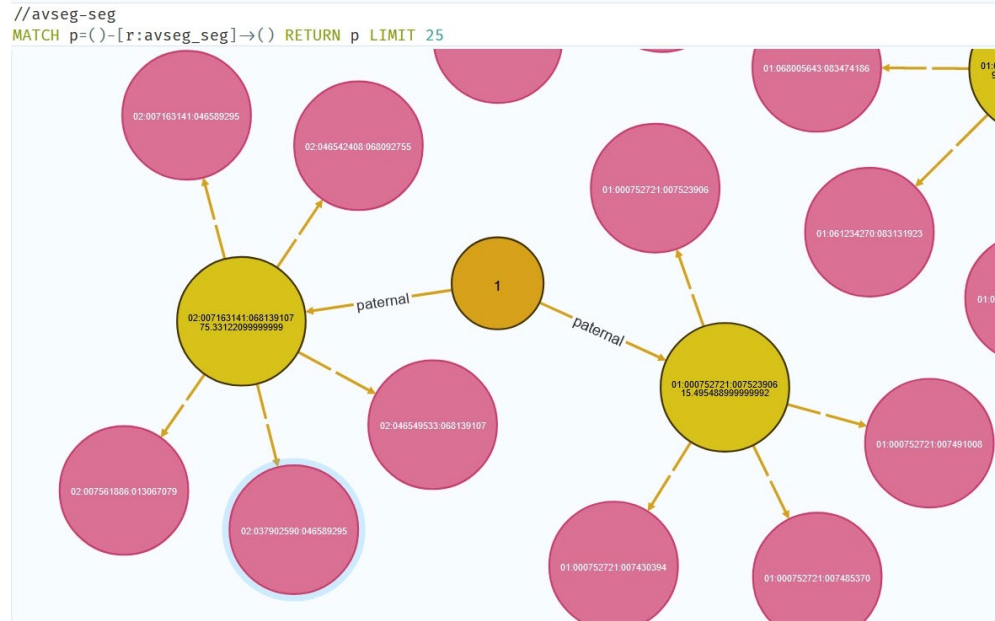

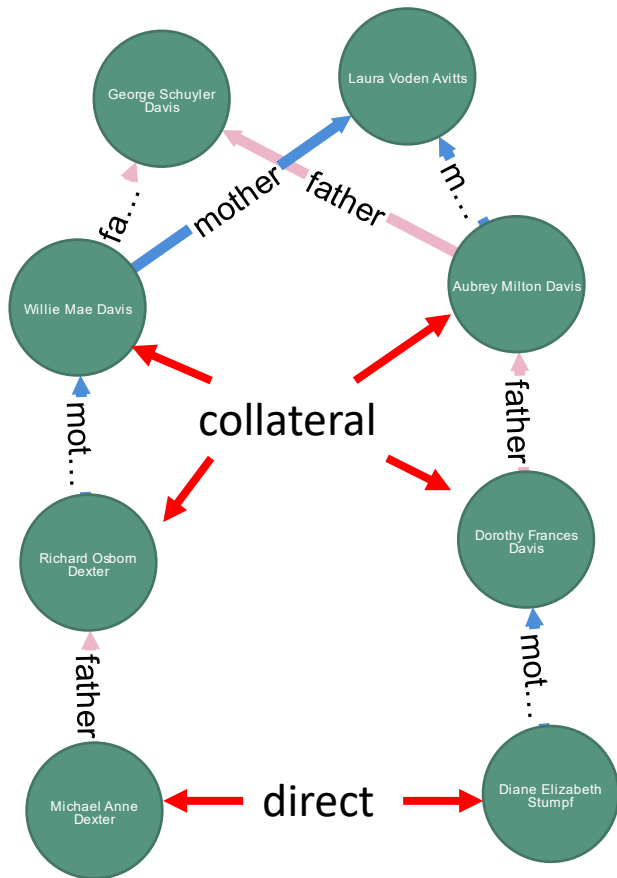

- `match_segment` relationships
 - GFG adds knowledge
 - parental origin of segment
 - Relationship between match-pair
 - MRCAs

Avatar creation is enabled by the knowledge.

Assigning segments with parental side

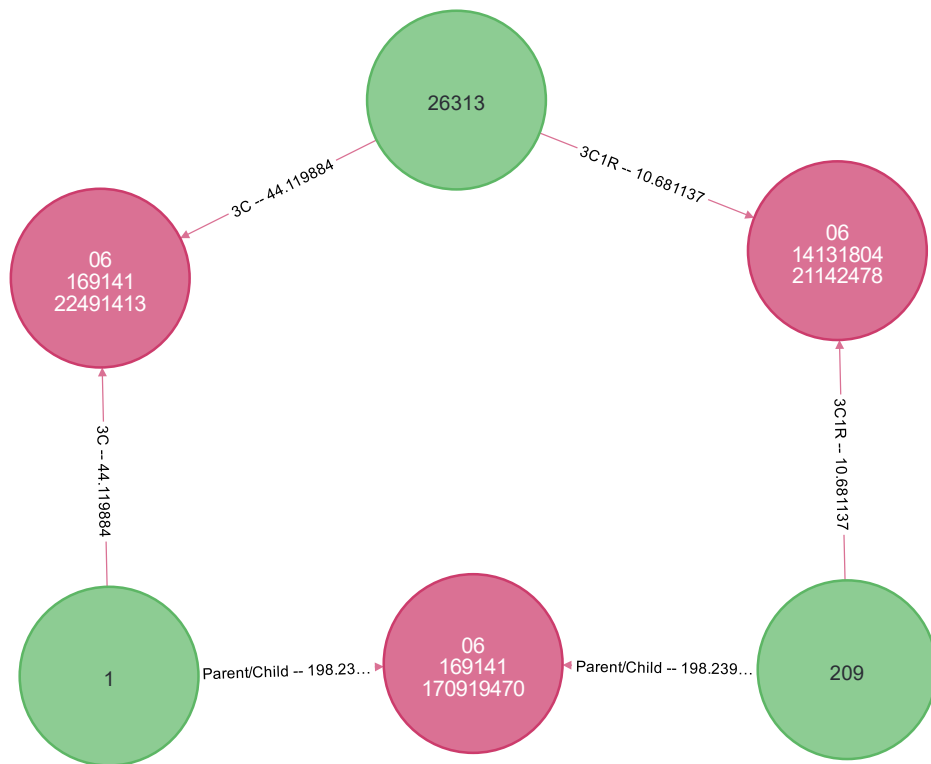

- match** path=(p1:Person{RN:210})-[r1:father | mother*0..6]->(mrca:Person)<-[r2:father | mother*0..6]-(p2:Person{RN:582}) **return** path

Inferred Segments

Assigning a grandparent's segment

- Inferred segments when segments overlap

One query does it all!

Find base and close relation using $\text{cor} \geq 0.25$

Find compare relative who matches base and close $\text{cor} \geq >0.00125$

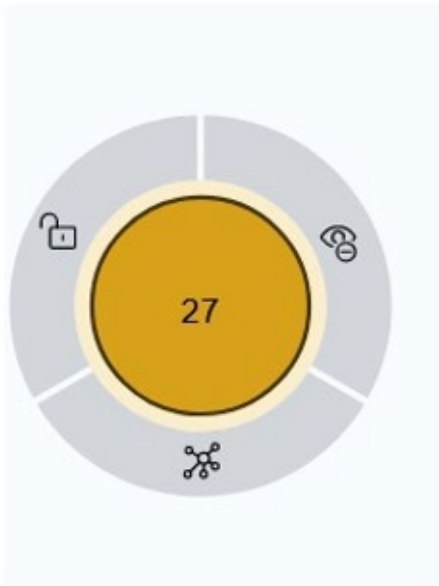

Identify segments shared with compare relative and compute flanking regions that are not shared.

Assign the flanking regions to the grandparent who is NOT in the shared family line.

Anderson Avitts (1843-1877)

A. Avitts

The Field of Dreams

What your ancestor and relative avatars tell you

- Avatars have family trees
- Avatar match their descendants
- Avatars define crisp triangulation groups
- Avatars match a few not in the family tree ... yet
- Avatars illuminate autosomal haplotrees
 - Avatar segments are linked to their source
 - Descendants know the ancestral origin of segments
 - Segment “checkerboard” enhances analytic specificity
- Relative avatars segments: help place new matches?
- Inferred segments help with tangential line research

Graph Algorithms

What's Next

Many Opportunities

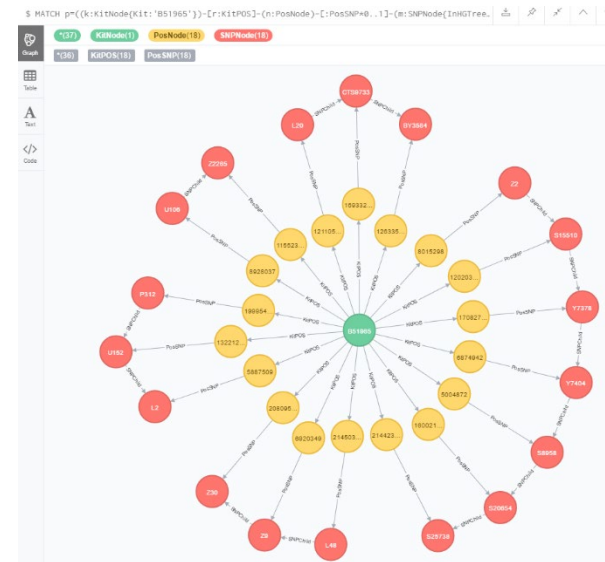

- Machine Learning
- Y-DNA analytics
- mt-DNA analytics
- FAN groups
- Spatial analytics
- Automated 3rd party interface
- 3-D renderings
- Virtual reality
- Forensic graphs
- Evidence graphs

Knowledge Graph Enhancements

... driven by user engagement

- Avatars on many family lines
- mt-haplotree enhancements
- Improved surname linkages
- FAN Groups capabilities
- Other vendor DNA results

Ancestral surname reports

... 3 worksheets

- Matches with the surnames
 - Match
 - Source kit
 - Shared cm and segment count
- In-common-with matches
 - Match
 - Cluster of icw matches
 - MRCAs of the cluster of matches, if identifiable
- Shared segments
 - Matches at segments (usually a short list)
